

## Hawaii: Land of Fire and gardens

Free lecture at the Notre-Dame-du-Nord Thematic Fossil Centre (819-723-2500)  
May 14, 2011 at 7 PM

The Hawaiian Islands offer striking contrasts from one island to another. At its southeastern end, the island of Hawaii (Big Island) is the youngest with still active volcanoes and plants that colonize the lava fields progressively older. At its northwestern end, the island of Kauai is the oldest and is nicknamed the Garden Island because of its tropical rainforest in the center of the island and its flora.

With the help of a very illustrated slide show, we invite you to discover the Hawaiian flora at both ends of the Hawaiian archipelago. This conference will be held in French.

**Speaker: Serge Perreault is a geologist.**

He worked among others on the North Shore and in Nunavik (Ungava). On the North Shore, he had founded with Michele Paquette Society of Natural Sciences of Sept-Iles, a nonprofit organization, which was discovered using field trip geology and flora of the Coast North.
